

This comment is on the BPL issue. I am a storm spotter for Eastern NE. The people in this state rely on the information supplied to them by the local weather. The weather-men get their information from the National Weather Service, and they get their information from local storm spotters who are out in the field communicating with ham radios. Is it worth the chance that information may be lost because of transmission interference due to BPL? How much money is one lost life worth? If there is any chance of interference then the answer to BPL must be no!! We as storm spotters are willing to put our lives on the line to help others in times of emergencies. Help us to help them, remember someday it might be your family depending on the information of an amateur radio operator.
